

VDIC lab2 test specification:

All tests were done with randomly generated addresses and data.

- TEST_PROPER_FRAME – proper initialization of routing array and sending data. Expected result – all data send to proper destination.
- TEST_WRONG_START_BIT – proper initialization of routing array and sending data with incorrect start bit. Expected result – wrong frames should not be sent, test may return error because it is chance to appear for unexpected frame built from proper data, parity and stop bits, this behavior is expected.
- TEST_WRONG_PARITY_BIT – proper initialization of routing array and sending data with incorrect parity bit. Expected result – wrong frames should not be sent.
- TEST_WRONG_STOP_BIT – proper initialization of routing array and sending data with incorrect stop bit. Expected result – wrong frames should not be sent.
- TEST_WRONG_START_PARITY_STOP_BIT – proper initialization of routing array and sending data with incorrect start, parity, stop bit. Expected result – wrong frames should not be sent, test may return error because it is chance to appear for unexpected frame built from proper data and incorrect start, parity and stop bits, this behavior is expected.
- TEST_RESET – proper initialization of routing array, reset switch while sending data. Expected result – no data send.
